

5 REASONS TO IMPLEMENT EC/LO PRO™

Whether you are considering a remote control locomotive (RCL) system for the first time or already use it to improve the safety of your operation, here are five reasons to implement Cattron's EC/LO Pro system today.

1 INCREASED SAFETY

Keeping employees safe is a top priority for any rail operation. RCL positions your operators in a safe location while not compromising their ability to control and operate the locomotive. Optional safety features can be added to the system. For example, two-way RF communication ensures the operators have access to critical status information at all times.

2 CERTIFICATION

Meeting almost any frequency requirement, EC/LO Pro products conform to EN50126, EN50128, EN50129, EN50239, EN50255 and VDV 211, are CE-compliant, meet TSI requirements with EBA approval pending and have RED (Radio Equipment Directive) approval. Various operator control versions are available to match local requirements.

3 IMPROVED PRODUCTIVITY

Implementing RCL frees up employees so they can be deployed to other critical functions in the yard. In many cases, up to two full-time employees can be redeployed per shift or per operation, saving you time and resources and increasing the efficiency of your operation.

4 MODULAR CONFIGURATION

Designed for various rail operations, EC/LO Pro includes a variety of features and options that enable you to tailor the system to fit your needs. Some available options are: a powerful alerting device for safety, LED flashlight embedded into OCU, TransLoop RFID features, cross-border operation, pitch & catch as well as multitransmitter operation.

5 EXTENSIVE EXPERIENCE

For more than 70 years, Cattron has built extensive domain expertise in improving safety, efficiency and productivity for rail operations of every kind. Class I, II and III railroads, locomotive OEMs and industrial rail operators on a global basis rely on Cattron solutions to keep their businesses running smoothly, safely and with the latest in remote control expertise.
